Chapter 3

Data Structure Documentation

3.1 Graph_Params Struct Reference

Data Fields

- unsigned short [n](#)
- unsigned short [m_min](#)
- unsigned short [m_max](#)
- unsigned short [m_crit](#)
- unsigned long long [n_graphs](#)
- unsigned long long [n_trees](#)

3.1.1 Detailed Description

Graph parameters structure, declared as a new type.

Definition at line [88](#) of file [rand_graph_lib.c](#).

3.1.2 Field Documentation

3.1.2.1 [n](#)

[n](#)

Number of labeled vertices.

Definition at line [90](#) of file [rand_graph_lib.c](#).

3.1.2.2 [m_min](#)

[m_min](#)

Minimal number of edges in a connected graph (tree):

$m_{min} = n - 1$ (tree).

Definition at line [90](#) of file [rand_graph_lib.c](#).

3.1.2.3 m_max

m_max

Maximal possible number of edges in the complete graph with n labeled vertices:

$$m_{max} = \binom{n}{2} = \frac{n(n-1)}{2} \text{ (complete graph).}$$

Definition at line 90 of file [rand_graph_lib.c](#).

3.1.2.4 m_crit

m_crit

Number of edges as connectedness threshold:

$$m_{crit} = \binom{n-1}{2} = \frac{(n-1)(n-2)}{2}.$$

Definition at line 90 of file [rand_graph_lib.c](#).

3.1.2.5 n_graphs

n_graphs

Maximal possible number of graphs with n labeled vertices:

$$n_{graphs} = 2^{m_{max}}.$$

Definition at line 91 of file [rand_graph_lib.c](#).

3.1.2.6 n_trees

n_trees

Maximal possible number of trees with n labeled vertices, p.292, Erdős [3] :

$$n_{trees} = n^{n-2}.$$

Definition at line 91 of file [rand_graph_lib.c](#).

The documentation for this struct was generated from the following file:

- [rand_graph_lib.c](#)

Chapter 4

File Documentation

Definition in file [rand_graph_lib.c](#).

4.1.2 Typedef Documentation

4.1.2.1 GP

```
typedef struct Graph_Params GP
```

4.1.3 Function Documentation

4.1.3.1 binom()

```
unsigned long long binom (
    unsigned short n,
    unsigned short k )
```

Find binomial coefficient $C(n, k)$.

Parameters

n	Integer number n
k	Integer number k

Returns

Binomial coefficient

Implementation notes:

1. Optimized algorithm without explicit calculation of factorial.
2. Integer overflow unsafe, since the result size is not checked during calculation and before return.
3. Time complexity: $\mathcal{O}(r)$, where $r = \min(k, n - k)$.

Definition at line 24 of file [rand_graph_lib.c](#).

4.1.3.2 calc_graph_params()

```
GP calc_graph_params (
    unsigned short n )
```

Populate and return graph parameters as a structure.

Parameters

n	Number of labeled vertices
-----	----------------------------

Returns

Graph parameters as per structure [Graph_Params](#)

Implementation notes:

1. Integer overflow unsafe, since the rhs's size is not checked before assignment.

Definition at line [103](#) of file [rand_graph_lib.c](#).

4.1.3.3 A006125_total()

```
unsigned long long A006125_total (
    unsigned short n )
```

Find the total number of labeled graphs (connected and disconnected) with n nodes – sequence A006125 [\[4\]](#).

Parameters

n	Graph order – number of vertices
-----	----------------------------------

Returns

Number of labeled graphs

Implementation notes:

1. The number of labeled graphs (connected and disconnected) with n nodes is [GP::n_graphs](#).
2. Integer overflow unsafe, since the result's size is not checked before return.
3. Time complexity: $\mathcal{O}(\text{pow})$.

Results for $n \in [0, 11]$:

n	A006125(n)
0	1
1	1
2	2
3	8
4	64
5	1 024
6	32 768
7	2 097 152
8	268 435 456
9	68 719 476 736
10	35 184 372 088 832
11	36 028 797 018 963 968

Definition at line [141](#) of file [rand_graph_lib.c](#).

4.1.3.4 A001187_conn()

```
unsigned long long A001187_conn (
    unsigned short n )
```

Find the number of connected labeled graphs with n nodes constructed with the Erdős–Rényi model $\mathcal{G}(n, M)$ – sequence A001187 [5].

Parameters

n	Graph order – number of vertices
-----	----------------------------------

Returns

Number of connected labeled graphs

Implementation notes:

1. In this model each graph is chosen randomly with equal probability of $1/n_{graphs}$, where n_{graphs} is [GP::n_graphs](#).
2. The number C_n of labeled connected graphs of order n is given by the recursive formula (1.2.1), p. 7, Harary [1]; p was substituted with n to avoid confusion with notation of probability.

$$C_n = 2^{\binom{n}{2}} - \frac{1}{n} \sum_{k=1}^{n-1} k \binom{n}{k} 2^{\binom{n-k}{2}} C_k.$$

3. Integer overflow unsafe, since the result's size is not checked during calculation and before return.
4. Time complexity: $\mathcal{O}(2^{n \max(\mathcal{O}(\text{binom}), \mathcal{O}(\text{pow})) - 1})$.

Results for $n \in [0, 11]$:

n	A001187(n)
0	1
1	1
2	1
3	4
4	38
5	728
6	26 704
7	1 866 256
8	251 548 592
9	66 296 291 072
10	34 496 488 594 816
11	35 641 657 548 953 344

Definition at line 183 of file [rand_graph_lib.c](#).

4.1.3.5 A054592_disconn()

```
unsigned long long A054592_disconn (
    unsigned short n )
```

Find the number of disconnected labeled graphs with n nodes – sequence A054592 [6].

Parameters

n	Graph order – number of vertices
-----	----------------------------------

Returns

Number of disconnected labeled graphs

Implementation notes:

1. Number of labeled graphs (connected and disconnected) with n nodes is sequence A006125 [4]. Number of connected labeled graphs with n nodes is sequence A001187 [5]. Thus, the number of disconnected labeled graphs with n nodes is simply $A054592(n) = A006125(n) - A001187(n)$.
2. Integer overflow unsafe, since the result's size is not checked during calculation and before return.
3. Time complexity: $\max(\mathcal{O}(A006125_total), \mathcal{O}(A001187_conn))$.

Results for $n \in [0, 11]$:

n	A054592(n)
0	0
1	0
2	1
3	4
4	26
5	296
6	6 064
7	230 896
8	16 886 864
9	2 423 185 664
10	687 883 494 016
11	387 139 470 010 624

Definition at line 229 of file rand_graph_lib.c.

4.1.3.6 prob_conn()

```
double prob_conn (
    unsigned short n,
    double p )
```

Find the probability of connectedness of a random labeled graph constructed with the Gilbert model $\mathcal{G}(n, p)$.

Parameters

n	Graph order – number of vertices
p	Edge probability $0 \leq p \leq 1$

Returns

$$P_n = P(\mathcal{G}(n, p) \text{ is connected})$$

Implementation notes:

1. In this model every possible edge occurs independently with probability p . The probability of obtaining any one particular random graph with m edges is $p^m(1-p)^{N-m}$, where N is [GP::m_max](#).
2. The probability of connectedness of a random labeled graph is given by the recursive formula (3), p. 2, Gilbert [2]; q was substituted by $1-p$ to avoid introducing unnecessary new variable; N was substituted by n to avoid confusion with N above.

$$P_n = 1 - \sum_{k=1}^{n-1} \binom{n-1}{k-1} (1-p)^{k(n-k)} P_k.$$

3. Integer overflow unsafe, since the result's size is not checked during calculation and before return.
4. Time complexity: $\mathcal{O}(2^{n \max(\mathcal{O}(\text{binom}), \mathcal{O}(\text{pow})) - 1})$.

Results for P_n for $n \in [2, 11]$ and $p \in [0.1, 0.9]$:

n / p	0.1	0.2	0.3	0.4	0.5	0.6	0.7	0.8	0.9
